

Dear Editor,

First of all, let me give you many thanks for this opportunity to submit my paper in your journal. All the authors including me have equal contribution regarding this manuscript.

Bangladesh is a developing country and most of her people depend on agriculture. And livestock rearing is getting more popularity among them. However, there are a lot of diseases which cause a great economic loss by affecting the livestock populations. Among them, parasitic diseases keep a major contribution. Due to having limited knowledge about different prevailing parasites, the condition is going to worse day by day. Moreover, a few works have been done on gastrointestinal parasite especially on *Paramphistomum spp.* From this point of view, we conducted this research for familiarize with the Paramphistomiosis of cattle.

We hope, the study will address the farmers about the possible health hazards by *Paramphistomum sp* in cattle. We could not able to elaborate our research area for limited fundings. But, we have a plan for molecular identification of parasites of cattle and for assessing the effects of the parasites on the health and production of cattle.

We expect your kind concern of having a look on our manuscript and publishing on your journal.

Eagerly waiting for your response.

Kazal Krishna Ghosh,
On behalf of all Authors
